

- Context
- Charged Meson Form Factors
- JLab 12 GeV data
- EIC Measurement and Simulation

30/11/2020

- Work so far has been focused on feasibility studies of pion form factor measurements at the EIC
- Utilising pion event generator created by Z. Ahmed
- Work straddles two different working groups
 - Exclusive reactions working group
 - Meson structure working group
- Regular meetings (fortnightly) with the meson structure group
- Progress on pion studies included in the yellow report
- Also presented progress at the CFNS workshop in June 2020
 - https:

//indico.bnl.gov/event/8315/contributions/37023/
attachments/28561/44027/Kay_Stephen_CFNS2020.pdf

Context - Current Activities and Future Direction

- Finalising some improvements to the pion event generator
 Improvements to efficiency and flexibility
- Aiming to write a paper on the pion generator once improvements have been made
- Also planning to investigate the feasibility of creating a kaon event generator

• Project for new EIC Canada MSc student at UoR

 If successful, also aim to write a paper on the kaon event generator

Charged Meson Form Factors

- Simple $q\bar{q}$ valence structure of mesons makes them an excellent testing ground
- Pion form factor , F_{π} , is the overlap integral -

• Meson wave function can be split into $\phi_\pi^{\rm soft}$ $(k < k_0)$ and $\phi_\pi^{\rm hard}$, the hard tail

 $\, \bullet \,$ Can treat $\phi^{\rm hard}_{\pi}$ in pQCD, cannot with $\phi^{\rm soft}_{\pi}$

• Study of Q^2 dependence of form factor focuses on finding description of hard and soft contributions

Stephen Kay University of Regina

• At very large Q^2 , F_π can be calculated using pQCD via -

$$F_{\pi}(Q^2) = \frac{4_F \alpha_s(Q^2)}{Q^2} \Big| \sum_{n=0}^{\infty} a_n \left(\log\left(\frac{Q^2}{\Lambda^2}\right) \right)^{-\gamma_n} \Big|^2 \left[1 + O\left(\alpha_s(Q^2), \frac{m}{Q}\right) \right]$$

30/11/2020

6 /37

Stephen Kay University of Regina

The Pion in pQCD (2 of 2)

• At asymptotically high Q^2 ($Q^2 \rightarrow \infty$), the pion distribution amplitude becomes -

$$\phi_{\pi}(x)
ightarrow rac{3t_{\pi}}{\sqrt{n_c}} x(1-x)$$

 $\,\circ\,$ With $f_{\pi}=$ 93 MeV , the $\pi^+ \rightarrow \mu^+ \nu$ decay constant

• F_{π} takes the form -

$$Q^2 F_{\pi}
ightarrow 16\pi lpha_s (Q^2) f_{\pi}^2$$

- This only relies on asymptotic freedom in QCD, i.e. $(\partial \alpha_s/\partial \mu) < 0$ as $\mu \to \infty$
- $Q^2 F_{\pi}$ should behave as $\alpha_s(Q^2)$, even for moderately large Q^2
- Pion form factor seems to be the best tool for experimental study of the nature of the quark-gluon coupling constant renormalisation

Eqns - G.P. Lepage, S.J. Brodsky, PLB 87, p359, 1979 | Closing Statement - A.V. Efremov, A.V. Radyushkin PLB 94, p245, 1980

Stephen Kay University of Regina

Recent Theoretical Advances

- Have a much better understanding of how Dynamical Chiral Symmetry Breaking (DCSB) generates hadron mass
- Evolution of the current-quark of pQCD into constituent quark was observed as its momentum becomes smaller
- The constituent quark mass arises from a cloud of low momentum gluons attaching themselves to the current quark
- Non-perturbative effect that generates a quark mass from nothing, occurs in even in the chiral (m = 0) limit

M.S. Bhagwat, et al., PRC 68(2003) 015203, L. Chang, et al., Chin.J.Phys. 49(2011)955

Stephen Kay University of Regina

30/11/2020

Implications for Pion Structure (1 of 2)

- Previous pQCD derivation used normalisation of F_{π} based on the conformal limit of the pion's twist 2-PDA - $\phi_{\pi}^{cl}(x) = 6x(1-x)$
- Gives F_π that are "too small"
- Incorporating the DCSB effects yields Pion PDA -

$$\phi_{\pi}(x) = \frac{8}{\pi} \sqrt{x(1-x)}$$

L. Chang, et al., PRL110(2013) 132001

Stephen Kay

University of Regina

30/11/2020 9/37

- Using this $\phi_{\pi}(x)$ in the pQCD expression brings the F_{π} calculation much closer to the data
- Underestimates the full computation by $\sim 15\%$ for $Q^2 \geqslant 8~GeV^2$

Stephen Kay

L. Chang, et al., PRL111(2013) 141802

30/11/2020

10/37

A $2^{\rm nd}$ Test Case - The Charged Kaon

• In the hard scattering limit, pCQD predicts F_{π} and F_{K} will behave similarly -

$$rac{F_{\mathcal{K}}(Q^2)}{F_{\pi}(Q^2)}
ightarrow rac{f_{\mathcal{K}}^2}{f_{\pi}^2}$$

30/11/2020

11/37

 $\circ\,$ Should compare the magnitude and Q^2 dependences of both form factors

Stephen Kay University of Regina

Effects of DCSB on K^+ Properties

- K^+ PDA is also broad, concave and asymmetric
- Heavier *s* quark carries more bound state momentum than the *u* quark, shift is less then one might expect based on the difference in current quark masses.

C. Shi, et al., PRD 92 (2015) 014035, F. Guo, et al., PRD 96(2017) 034024 (Full calculation)

Stephen Kay

University of Regina

30/11/2020

Measurement of F_{π} - Low Q^2

- $\, \bullet \,$ At low $Q^2,$ F_{π} can be measured model independently
- High energy elastic π⁻ scattering from atomic electrons in H
 CERN SPS used 300 GeV pions to measure F_π up to
 - $Q^2 = 0.25 \ GeV^2$
- Used data to extract pion charge radius $r_{\pi} = 0.657 \pm 0.012$ fm
- Maximum accessible Q² approximately proportional to pion beam energy
 - $Q^2 = 1 \ GeV^2$ requires 1 TeVpion beam (!)

Amendolia, et al., NPB 277(1986) p168, P. Brauel, et al., ZPhysC (1979), p101, H. Ackerman, et al., NPB137 (1978), p294

Stephen Kay

University of Regina

30/11/2020

- To access higher Q^2 , must measure F_{π} indirectly
 - Use the "pion cloud" of the proton via pion electroproduction $p(e, e'\pi^+)n$
- At small -t, the pion pole process dominates the longitudinal cross section, σ_L
- In the Born term model, F_{π}^2 appears as -

$$rac{d\sigma_L}{dt} \propto rac{-tQ^2}{(t-m_\pi^2)}g^2(t) F_\pi^2(Q^2,t)$$

- Drawbacks of this technique -
 - Isolating σ_L experimentally challenging
 - Theoretical uncertainty in F_{π} extraction
 - \rightarrow Model dependent

Stephen Kay

14/37

30/11/2020

• The physical cross section for the electroproduction process is given by -

$$2\pi \frac{d^2\sigma}{dtd\phi} = \epsilon \frac{d\sigma_L}{dt} + \frac{d\sigma_T}{dt} + \sqrt{2\epsilon(\epsilon+1)} \frac{d\sigma_{LT}}{dt} \cos\phi + \epsilon \frac{d\sigma_{TT}}{dt} \cos 2\phi,$$
$$\epsilon = \left(1 + 2\frac{(E_e - E_{e'})^2 + Q^2}{Q^2} \tan^2 \frac{\theta_{e'}}{2}\right)^{-1}$$

• $\epsilon
ightarrow$ Virtual photon polarisation

- L-T separation required to isolate σ_L from σ_T
- Need data at lowest -t possible, σ_L has maximum pole contribution here

Stephen Kay

30/11/2020

15/37

Measuring $\frac{d\sigma_L}{dt}$ at JLab

- Rosenbluth separation required to isolate σ_L
 - Fix W, Q^2 and -t, measure cross section at two beam energies
 - $\circ\,$ Carry out simultaneous fit at two different ϵ values to determine interference terms
- Careful control of point-to-point systematics crucial, 1/Δε error amplification in σ_L
- Spectrometer acceptance, kinematics and efficiencies must all be carefully studied and understood

30/11/2020

16/37

T. Horn, et al., PRL 97(2006) 192001

Extracting F_{π} at JLab

- Only reliable approach for extracting F_{π} from σ_L is to use a model that incorporates the π^+ production mechanism and the spectator nucleon
- JLab F_{π} experiments use the VGL Regge model
 - Reliably describes σ_L across a wide kinematic domain
- Ideally, want a better understanding of the model dependence of the result
- There has been considerable recent interest
 - T.K. Choi, K.J. Kong, B.G. Yu, arXiv 1508.00969
 - T. Vrancx, J. Ryckebusch, PRC 89(2014)025203
 - M.M. Kaskulov, U. Mosel, PRC 81(2010)045202
 - S.V. Goloskokov, P.Kroll, EPJC 65(2010)137
- We aim to publish our experimentally measured cross section data so that updated values of F_{π} can be extracted as the models improve

VGL - Vanderhaeghen-Guidal-Laget Model - Vanderhaeghen, Guidal, Laget, PRC 57(1998) 1454

Stephen Kay University of Regina

30/11/2020

$F_{\pi}(Q^2)$ from JLab Data

VGL model incorporates π^+ production mechanism and spectator neutron effects

- Feynman propagator $\frac{1}{t-m_{\pi}^2}$ replaced by π and ρ Regge propagators
- Represents the exchange of a series of particles, compared to a single particle
- Free parameters $\Lambda_{\pi}, \Lambda_{\rho}$ Trajectory cutoff parameters
- At small -t, σ_L only sensitive to F_{π} $F_{\pi} = \frac{1}{1 + Q^2 / \Lambda_{\pi}^2}$

Stephen Kay

Error bars indicate statistical and random (pt-pt) systematic uncertainties in quadrature. Yellow band indicates the correlated (scale) and partly correlated (t-corr) systematic uncertainties.

 $\Lambda_{\pi}^2 = 0.513, 0.491 \ GeV^2, \Lambda_{\rho}^2 = 1.7 \ GeV^2$ T. Horn, et al., PRL 97(2006) 192001

University of Regina

30/11/2020

Current and Projected JLab F_{π} Data

- JLab 12 GeV program includes measurements of F_{π} to higher Q^2
- No other facility worldwide can perform this measurement
- New overlap points at $Q^2 = 1.6, 2.45$ will be closer to pole to constrain $-t_{min}$ dependence
- Check π^+/π^- ratios at modest Q^2 to test *t*-channel dominance

• New low Q^2 point will provide best comparison of the electroproduction extraction of F_{π} vs elastic $\pi + e$ data

Stephen Kay University of Regina

30/11/2020

- Measurements of the $p(e, e'\pi^+n)$ reaction at the EIC have the potential to extend the Q^2 reach of F_{π} measurements even further
- A challenging measurement however
 - Need good identification of $p(e, e'\pi^+n)$ triple coincidences
 - $\,\circ\,$ Conventional L-T separation not possible \to would need lower than feasible proton energies to access low ϵ
- Utilise new EIC software framework to assess the feasibility of the study with updated design parameters
 - Feed in events generated from a DEMP event generator

DEMP Event Generator

Stephen Kay

- Want to examine exclusive reactions
 - $p(e, e'\pi^+ n)$ exclusive reaction is reaction of interest $\rightarrow p(e, e'\pi^+)X$ SIDIS events are background
- Generator uses Regge-based p(e, e'π⁺)n model from T.K. Choi, K.J. Kong and B.G. Yu (CKY) - arXiv 1508.00969
 - MC event generator created by parametrising CKY σ_L , σ_T for $5 < Q^2 < 35$, 2 < W < 10, 0 < -t < 1.2

30/11/2020

21/37

DEMP Event Generator

Stephen Kay

- Want to examine exclusive reactions

- Generator uses Regge-based p(e, e'π⁺)n model from T.K. Choi, K.J. Kong and B.G. Yu (CKY) - arXiv 1508.00969
 - MC event generator created by parametrising CKY σ_L , σ_T for $5 < Q^2 < 35$, 2 < W < 10, 0 < -t < 1.2

30/11/2020

22 / 37

DEMP Acceptance for $-t < 0.5 \ GeV^2$

- $5(e^{-})$ on 100(p) GeV collisions, 25 mrad crossing angle
- Events weighted by cross section
- No smearing

- ${\scriptstyle \circ }$ Momentum is radial and angle is θ WRT proton beam line
- Neutrons carry large fraction (\sim 80%) of *p* momentum, within 0.2° of outgoing proton beam, offset is due to the crossing angle (25 mrad \approx 1.4°)

DEMP Event Detection

- *n* detected in ZDC
- π^+ detected in Hadron Endcap
- e' detected in Lepton Endcap/Central Detector

Electron Acceptance Across Q² - 5 on 100

 $Q^2 = 6.25 - 7.5 \text{ GeV}^2$ $Q^2 = 8.75 - 10 \text{ GeV}^2$ $Q^2 = 11.25 - 12.5 \text{ GeV}^2$

 $Q^2 = 13.75 \cdot 15 \text{ GeV}^2$ $Q^2 = 20 \cdot 25 \text{ GeV}^2$

 $Q^2 = 30-35 \text{ GeV}^2$

Stephen Kay

University of Regina

30/11/2020 28 / 37

DEMP Acceptance - 5 on 41

Q² > 4 GeV² cut applied, low Q² events dominate otherwise
 High weight on low Q² events

30/11/2020

29 / 37

- Neutron distribution broader in θ
 - May miss ZDC? Need to run full simulation and see

University of Regina

Stephen Kay

DEMP Kinematic Coverage - 5 on 41

 $\xi = {\rm skewness}$

30/11/2020

30 / 37

- $Q^2 > 4 \ GeV^2$ cut applied
- Similar kinematic coverage to 5 on 100

Stephen Kay Univ

- Want to isolate a clean sample of p(e, e'π⁺n) events by detecting the neutron
- SIDIS $p(e, e'\pi^+)X$ events a large source of background
 - Utilised the EIC SIDIS event generator by Duke University to generate SIDIS background events

30/11/2020

- o /work/eic/evgen_DUKE/e5p100 on the JLab farm
- Both the DEMP and SIDIS generators produce LUND format files that can be interpreted within the EIC software container

DEMP vs SIDIS Kinematics

- DEMP events are $e'\pi^+n$ triple coincidence
- SIDIS events are $e'\pi^+$ double coincidence, p_{miss} reconstructed

- SIDIS events overwhelm foreground exclusive events, but distributed over wider momentum range and at larger -t
- Note Plots from earlier study with smearing included

University of Regina

Isolating σ_L from σ_T in an e-p Collider

• For a collider -

$$\epsilon = \frac{2(1-y)}{1+(1-y)^2}$$
 with $y = \frac{Q^2}{x(s_{tot} - M_N^2)}$

• y is the fractional energy loss

• Systematic uncertainties in σ_L magnified by $1/\Delta\epsilon$

• Ideally, $\Delta\epsilon > 0.2$

- To access $\epsilon < 0.8$ with a collider, need y > 0.5
 - Only accessible at small stot
 - Requires low proton energies (\sim 10 GeV), luminosity too low
- Conventional L-T separation not practical, need another way to determine σ_L

$\sigma_{\rm L}$ Isolation with a Model

- QCD scaling predicts $\sigma_L \propto Q^{-6}$ and $\sigma_T \propto Q^{-8}$
- At the high Q^2 and Waccessible at the EIC, phenomenological models predict $\sigma_L \gg \sigma_T$ at small -t
- Can attempt to extract σ_L by using a model to isolate dominant $d\sigma_L/dt$ from measured $d\sigma_{UNS}/dt$
- Critical to confirm the validity of the model used!

Stephen Kay

Predictions are assuming $\epsilon > 0.9995$ with the kinematic ranges seen earlier T.Vrancx, J. Ryckebusch, PRC 89(2014)025203

34 / 37

University of Regina

30/11/2020

Model Validation via π^-/π^+ ratios

- Measure exclusive ²H(e, e'π⁺n)n and ²H(e, e'π⁻p)p in same kinematics as p(e, e'π⁺n)
- π *t*-channel diagram is purely isovector \rightarrow G-Parity conserved $R = \frac{\sigma [n(e, e'\pi^- p)]}{\sigma [p(e, e'\pi^+ n)]} = \frac{|A_V - A_S|^2}{|A_V - A_S|^2}$
- R will be diluted if σ_T not small or if there are significant non-pole contributions to σ_L
- Compare R to model expectations

30/11/2020

35 / 37

T.Vrancx, J. Ryckebusch, PRC 89(2014)025203

Stephen Kay University of Regina

EIC Kinematic Reach

Assumptions

- 5(e⁻) on 100(p)
- $\int \mathcal{L} = 20 \ \textit{fb}^{-1}\textit{yr}^{-1}$
- Clean identification of $p(e, e'\pi^+n)$
- Syst.Unc: 2.5% pt-pt, 12% scale
- $R = \sigma_L / \sigma_T = 0.013 0.14$ at lowest -t from VR model
- $\delta R = R$ Syst.Unc in model subtraction to isolate σ_L
- π pole dominance at small
 - -t confirmed in $^{2}H \pi^{+}/\pi^{-}$

model σ_L \odot Ressmall nee π^+/π^- fur

 Results look promising, but need further studies and further energy combinations

Stephen Kay

University of Regina

30/11/2020 36 /37

Outlook and Future Plans

- Higher Q^2 data on F_{π} vital for our understanding of hadronic physics
 - Pion properties connected to DCSB
 - F_{π} is our best hope of observing QCD's transition from confinement-dominated physics to perturbative QCD
- Measurement of F_{π} at the EIC will be challenging
 - Conventional L-T separation not possible
 - Should be possible to use a model to separate σ_L from the unseparated cross section
 - Can use π^-/π^+ ratio in e+d collisions to validate model
 - Replicate and improve upon previous smearing studies, process files through full geant simulation, process other beam energy combinations
- Building on our current event generator, new MSc student will build a Kaon event generator based on VR model
 - Will attempt to measure F_K in a similar manner
 - Further challenges to address for such a study!
